

Medication Information Sheet

arsenic trioxide (AR-se-nik tri-OX-ide)

This document provides general information about your medication. It does not replace the advice of your health care professional. Always discuss your therapy with your health care professional and refer to the package insert for more details.

Other Name: Trisenox®

Appearance: clear, colourless solution mixed into larger bags of fluids

What is this medication for?

- For treating a type of leukemia called acute promyelocytic leukemia (APL)

What should I do before I have this medication?

- Tell your doctor and pharmacist if you have/had significant medical condition(s), especially if you have / had heart (including irregular heartbeat), liver or kidney problems, diabetes or any allergies.
- People who have cancer or leukemia are at a higher risk of developing other cancers/leukemias (usually some years later) or blood clots. Some cancer medications may increase these risks, especially if used for a prolonged period of time. You should discuss any concerns with your doctor.

How will this medication affect sex, pregnancy and breastfeeding?

- Arsenic trioxide can harm the unborn baby and should not be used by pregnant women.
- If there is ANY chance that you or your partner may become pregnant, you and your partner together must: ► **Use 2 effective forms of birth control at the same time** while receiving this drug: Keep using birth control until **3 months** after the last dose. Discuss with your healthcare team.
- Tell your doctor right away if you or your partner becomes pregnant.
- Do not breastfeed while taking this drug and for 3 months after treatment ends.
- Effects on Fertility: Probable

How is this medication given?

- This drug is given by injection into a vein.
- The infusion is usually given over 1 to 2 hours, but may last longer if side effects like flushing and dizziness occur.

Prepared with input from the Cancer Care Ontario-Medication Information Sheets Working Group.

April 2016

What else do I need to know while on this medication?

- This medication can interact with other medications and can result in the treatment not working as well or cause severe side effects.
- Make sure your health care team knows about all your medications (prescription, over-the-counter, herbals and supplements). Check with your health care team before starting or stopping any of them.
- For mild aches and pain:
 - You may take acetaminophen (Tylenol®) tablets. Ask your health care team about the right dose for you.
 - Talk to your health care team first before starting ibuprofen (Advil®, Motrin®), naproxen (Aleve®) or aspirin (acetylsalicylic acid, ASA), since these may increase your chance of bleeding.
 - If you are already taking aspirin regularly, such as for heart conditions; Do not stop it- talk to your health care team first.
 - If you feel unwell, take your temperature before using any of these drugs. They may hide a fever. **Phone your health care team or go to the closest emergency room right away if you have a fever.** See the [Fever](#) pamphlet for more information.

What are the side effects of this medication?

Common side effects usually occur in more than 1 out of every 10 patients. Other side effects are less common, but may be severe. You may not have all of the side effects below. You may have side effects that are not listed. Discuss with your health care team if you have any unusual or bothersome symptoms.

Side effects and what to do	When to contact doctor?
More Common Side Effects
